Course Overview

Module 1 (10 CP) compulsory: Neuroanatomy and Neurophysiology

Module 2 (6 CP) compulsory elective: Methods in Neurosciences I

  Module 2a: Foundations of Medical Physics
  Module 2b: High-Throughput Analysis: Genomics and Proteomics

Module 3 (14 CP) compulsory elective: Translational Neuroscience I

  Module 3a: Neurocytology, cell differentiation and regeneration of the nervous system
  Module 3b: Cellular and Molecular Analyses of Brain Function
  Module 3c: Cognitive Neuroscience: Methods
  Module 3d: Protein Pathology in Neurodegenerative Diseases and Mental Brain Disorders

Module 4 (8 CP) compulsory elective: Methods in Neurosciences II

  Module 4a: Experimental and Translational Neuroimaging
  Module 4b: Systems Neuroscience
  Module 4c: Cognitive Neuroscience: Functional Systems

Module 5 (14 CP) compulsory elective: Translational Neuroscience II

  Module 5a: Neuroimmunology
  Module 5b: Stem cell based brain organoids
  Module 5c: Methods in Neurosciences

Module 6 (8 CP) compulsory: Research Ethics and Technics

Pilot Project (15 CP) compulsory:
The pilot project is a 12-week placement in a laboratory, which serves to demonstrate research activities in the working groups. Students are assigned to a specific project on which they can work under one-to-one supervision.

Project Proposal (15 CP) compulsory:
The project proposal is an 8-week a placement in a laboratory, which serves as a preparatory exercise for the Master’s thesis. After its completion, a concept (project sketch) for the Master’s thesis is to be drawn up.

Master’s Thesis (30 CP) compulsory:
The Master’s thesis is a 6-month experimental work based on the project proposal. Students complete the experimental working phase with a concluding thesis and a colloquium.
General Information

This Masters programme in Translational Neuroscience is an international study programme and lectures and examinations are held in English. Therefore sufficient command of the English language is required. This proficiency in English should be at least the level B2 of the Common European Framework of Reference for Languages (CEFR).

The study programme consists of 6 Master modules followed by two practicals and is concluded with a 6-month Master’s thesis. The first and the last Master module “Neuroanatomy and Neurophysiology” and “Research Ethics and Technics” are compulsory. Modules of area 2 through 5 are compulsory electives and one of them must be chosen, e.g. from area 2 "Methods in Neuroscience I" either Module 2a or 2b or 2c. Depending on the individual interest in potential future occupational areas different study foci are offered:

- **Neuroimaging**
- **Regeneration of CNS Traumata**
- **Molecular Basis of Brain Development, Neurodegeneration and Disease**

For each study focus the following combinations of compulsory and compulsory elective modules are recommended:

**Neuroimaging:**
- 1 Neuroanatomy and Neurophysiology
- 2a Foundations of Medical Physics
- 3c Cognitive Neuroscience: Methods
- 4a Experimental and Translational Neuroimaging
- 5c Methods in Neurosciences or alternatively 5a Neuroimmunology
- 6 Research Ethics and Technics

**Regeneration of CNS Traumata:**
- 1 Neuroanatomy and Neurophysiology
- 2b High-Throughput Analysis: Genomics and Proteomics
- 3a Neurocytology, cell differentiation and regeneration of the nervous system or 3d Protein Pathology in Neurodegenerative Diseases and Mental Brain Disorders
- 4b Systems Neurosciences or 4c Cognitive Neuroscience: Functional Systems
- 5a Neuroimmunology or 5b Stem cell based brain organoids
- 6 Research Ethics and Technics

**Molecular Basis of Brain Development, Neurodegeneration and Disease:**
- 1 Neuroanatomy and Neurophysiology
- 2b High-Throughput Analysis: Genomics and Proteomics
- 3a Neurocytology, cell differentiation and regeneration of the nervous system or 3b Cellular and Molecular Analyses of Brain Function or 3d Protein Pathology in Neurodegenerative Diseases and Mental Brain Disorders
- 4b Systems Neurosciences or 4c Cognitive Neuroscience: Functional Systems
- 5a Neuroimmunology or 5b Stem cell based brain organoids or 5c Methods in Neurosciences
- 6 Research Ethics and Technics
Module Number 1

Title: Neuroanatomy and Neurophysiology

Module type: compulsory  Language: English  Group Size: 20 students

Study semester: 1  Availability: winter semester  Duration: 1 semester

Workload: 300 hrs  Credits: 10 CP  Contact time: 86 hrs  Independent Study: 214 hrs

Courses
a) Lectures 4 PPW
b) Practical course 1 PPW
c) Seminars 3 PPW

Intended Learning Outcomes
This first module will provide a common basis in neuroscience for all students being admitted from diverse BSc study programmes. Upon completion of this course the students should be able to describe and characterize the structural and functional organization of the nervous system and the neural basis of perception and movement. They are capable to localize those regions in post mortem brain tissue and in vivo brain images. They are capable to describe the molecular and cellular mechanisms, by which neurons code and convey information, how these mechanisms are modified by experience or disturbed by exemplary disease states. Students will be capable of applying these neurophysiologic basics to in vivo recordings of brain and muscle function. Students will be able to explain the working principles of selected perceptive organs (visual system, auditory system) and skeletal muscles.

Content
Preparatory self-study time:
In preparation to the topics presented in the lectures, practical courses and seminars, students will have one week prior to the official start of the module for focusing on the ontogenetic development of the human brain (Prereading Material: Keith L. Moore, Mark G. Torchia, T. V. N. Persaud; The Developing Human: Clinically Oriented Embryology; 10th edition, chapter 17 "Nervous System", pages 379-415). These topics will then be recapitulated at the beginning of the lectures and are relevant for passing the exam of the module.

Lectures:
The lectures will cover general principles in neuroanatomy and neurophysiology, sensory and motoric systems and integrative components of the nervous system and will highlight their relevance for clinical neurology. Specific topics in neuroanatomy cover: development of the nervous system, general structure of the human central and peripheral nervous system, organization of the brain based on the cellular and molecular architecture, cortical divisions and related functions, special senses and dedicated functional systems, spinal cord organization with ascending and descending fiber tracts, brain stem, cerebellum, diencephalon, basal ganglia, vascular blood supply, and cerebrospinal fluid system. Specific topics in physiology cover: molecular and cellular neurophysiology (properties of biological membranes, membrane potential, action potential, electrical and chemical synaptic transmission, somatodendritic integration, synaptic plasticity); skeletal muscle physiology (neuromuscular junction, electromechanical coupling, muscle mechanics; reflexes); sensory physiology (phototransduction, mechanotransduction, receptive field organization, central processing of sensory information); pathophysiologic principles (channelopathies, demyelination, basal ganglia degeneration, etc.). The lectures will conclude with histology, basics of human genetics and pathology (inherited, degenerative, inflammatory and oncological neurological diseases).

Practical courses:
Accompanying practical and theoretical exercises will deepen the lecture topics. The practical course in anatomy will concentrate on gross anatomy and histology of the human brain and spinal cord. Histology will cover examples of light microscopy as well as specific aspects of high-resolution methods such as electron microscopy and
polarized light imaging. Gyri and sulci as well as the components of different functional systems will be identified in post-mortem brain sections. This knowledge will be transferred from basic neuroanatomy to neuroimaging and clinical applications using series of MR images. The practical course in physiology will cover the intrinsic properties of excitable membranes, the recording and interpretation of extracellular potentials in humans (EMG, EEG), and the clinical examination of the nervous and selected sensory systems.

Students will perform the following methods:

- Identification of different brain structures in hemispheres and sections on post-mortem brain and their association with functional systems
- Microscopic delineation of brain areas in post-mortem brain sections
- Cortex delineation on MR images
- Recording and interpretation of extracellular potential in humans (EMG, EEG)
- Clinical examination of the nervous and selected sensory systems
- Electrophysiological analysis of cellular electrical signals and synaptic transmission
- Measurements of intracellular [Cl⁻] in glioblastoma cells
- Psychophysiological analysis of pain perception and somatic senses
- Nerve propagation velocity, Hoffmann reflex (H-reflex) analysis

Seminars:
The seminars will focus on specific aspects of neuroanatomy and –physiology, which will allow students to apply their acquired knowledge to gain insight into more complex cognitive processes such as pain perception, communication, timing and music, as well as in a more detailed understanding of normal and pathologically altered synaptic transmission. Students will work on these topics based on prepared material and literature, enabling them to appreciate the relevance of a profound basis in neuroanatomy and –physiology for the evaluation of neuroimaging findings and mechanistic theories.

Recommended reading, lecture notes:

4 Teaching methods
Lecture and practical training with accompanying theoretical exercises and seminars, self-study.

5 Prerequisites
A Bachelor or equivalent certificate in neurosciences or natural sciences, or a medical degree (MD); Basic knowledge in cell biology, biochemistry, and physics; Proficiency in English level B2 of Common European Framework of Reference for Languages (CEFR)

6 Examination types
Written exam (multiple-choice format) (108 minutes)

# Module Handbook HHU Düsseldorf MSc Translational Neuroscience

## Module Number 2a

**Title:** Foundations Medical Physics  
**Language:** English  
**Group Size:** 18 students  
**Study semester:** 1  
**Availability:** winter semester  
**Duration:** 1 semester  
**Workload:** 180 hrs  
**Credits:** 6 CP  
**Contact time:** 30 hrs  
**Independent Study:** 150 hrs

### Courses

1. **Lecture:** 1 PPW  
2. **Practical Course:** 2 PPW

### Intended Learning Outcomes

Upon completion of this course, students will be able to describe some of the physical concepts relevant to medicine, and identify their use in diagnostics and therapy. The students will be able to operate the laboratory equipment as described below, and connect the physical principles to the imaging techniques and technology.

### Content

**Lecture:**

1. **General introduction in physics of medical methods, from principle to functional details.** While the introduction covers also aspects that are needed for general understanding, the core of the lecture is designed to serve as theoretical background for the practical course.  
3. **Magnetic resonance.** Magnetic spins, Larmor frequency, spin resonance, spin interaction, contrast, electromagnetic induction.  
4. **Magnetic resonance imaging.** Spin manipulation, spin relaxation, spin-echo and gradient echo imaging techniques.  
5. **Ultrasound imaging.** Production and propagation of ultrasounds, imaging, absorption and reflection of ultrasounds, image resolution.  
6. **Electrocardiography and electroencephalography.** Production and transfer of electrical signals in the human body, physical interpretation of ECG and EEG.

**Practical Course:**

1. **x-Ray tomography.** 3D imaging and artefacts, absorption and scattering, image formation.  
2. **Magnetic resonance.** Measuring of the Larmor frequency, free induction decay, measuring of the relaxation times, effect of contrast substance.  
3. **Magnetic resonance imaging.** Spin-echo and gradient echo techniques. Effect of work parameters on the image quality.  
4. **Ultrasonic imaging.** Measuring of sizes and distances, 3D-imaging and artefacts. Measuring of the heart rate and cardiac output in a heart model. Ultrasonic control of the eye, using an eye model.  
5. **Electrocardiography and electroencephalography.** Measuring of own ECG, determination of the heart’s electric axis. Measurements of EEG signal (or use of muster data) to determine brain activity triggered by strong factors. Independent component analysis of the EEG.

### Teaching methods

Lecture on the concepts of medical physics and their experimental implementation (block of 15 lessons in one week); carrying out experiments in the laboratory, taking, analysis and interpretation of experimental data in the fields of the content (5 blocks of 5 teaching hrs each).

### Prerequisites

**Formal:** Proficiency in English level B2 of Common European Framework of Reference for Languages (CEFR)  
**With regards to content:** Basic knowledge of and interest in mathematics and physics
| 6 | **Examination types**  
Written report (The report should be about 10 pages per experiment, document the familiarity with the experimental work and contain the data taken as well as their analysis.) |
|---|---|
| 7 | **Requirements for award of credit points**  
Active participation on practical exercise; passing the oral examination prior to each experiment and submission of a report which gets graded with 4.0 or better four weeks after ending of practical exercise. |
| 8 | **Module applicability (in other study courses)**  
None |
| 9 | **Assessment**  
The mark given will contribute to the final grade in proper relation to its credits. |
| 10 | **Module convenor and main lecturers**  
Prof. Dr. Thomas Heinzel, PD Dr. Mihai Cerchez |
| 11 | **Further information**  
Pre-reading material will be handed out 2 weeks in advance of the laboratory course. The lecture is scheduled for the week preceding the laboratory course. The content of both the pre-reading material and the lecture is prerequisite for the admission to the experimental equipment. For safety reasons and for the conservation of high-value technical resources prior to each experiment the students will be examined orally regarding the operational principles of the experiment. Successful examination grants permission to start the experiment. |
Module Number 2b

Title:
High-Throughput Analysis: Genomics and Proteomics

Module type: compulsory elective  |  Language: English  |  Group Size: 5 students
Study semester: 1  |  Availability: Each winter semester  |  Duration: 1 semester

Workload: 180 hrs  |  Credits: 6 CP  |  Contact time: 55 hrs  |  Independent Study: 125 hrs

Courses
1 a) Lecture: 1 PPW
   b) Practical course: 3 PPW
   c) Seminar: 1 PPW

2 Intended Learning Outcomes
This module consists of a genomics and a proteomics part. Upon completion of the genomics part, the students will be able to describe the various gene regulation mechanisms on the DNA and RNA level and all necessary analytical tools to analyse genes, genomes, and gene expression. The students will be able to perform basic DNA and RNA analyses and they will be capable to describe and explain genome-wide, high-throughput DNA and RNA analyses in order to detect genomic variations and changes in gene expression. After completion of the proteomics part, the students will be able to describe and to apply state-of-the-art proteomic approach facilitating protein mass spectrometry (MS) and will be capable to describe the function of MS. They will be able to describe and apply data analysis for protein identification and quantification. The students will be able to discuss critically the obtained results and present basic aspects of genomics and proteomics in an oral presentation. Furthermore, they will be able to discuss the advantages and disadvantages of C. elegans as a model for neurodegenerative diseases.

3 Content
The lecture about genomics will cover basic aspects of eukaryotic gene expression and regulation. The theoretical background of PCR, classical Sanger sequencing, DNA microarray analysis, and next generation DNA and RNA Seq analyses will be described. The students will discuss the obtained results in a seminar.

The practical course will include:
- Isolation and purification of DNA and RNA
- Quantitative and qualitative nucleic acid measurements
- PCR
- DNA Sanger sequencing (detection of genetic variations)
- DNA microarray / NGS sequencing analyses (changes in gene expression)

In the practical course about proteomics the students will perform all steps for protein identification and quantification comprising:
- Sample preparation (lysis, homogenisation, digestion etc.)
- Peptide separation by UPLC
- Peptide analysis using LC-ESI-MS/MS
- Protein identification using data base searches
- Protein quantification

In the theoretical part the students will get insight into the set-up and function of mass spectrometers and the analysis of quantitative mass spectrometric data.

Furthermore, the students will get insights into a neurotoxic C. elegans model and will learn how to prepare worm samples for downstream analysis.
### 4 Teaching methods
Combination of lecture, hands-on practical course and seminar

### 5 Prerequisites
**Formal:** Proficiency in English level B2 of Common European Framework of Reference for Languages (CEFR)
**With regards to content:** Basic knowledge of cell biology and biochemistry

### 6 Examination types
Oral presentation (20 minutes)

### 7 Requirements for award of credit points
Regular and active participation in the practical course; written summary of the practical course; passing the final examination.

### 8 Module applicability (in other study courses)
Modul 2b is more technically/analytically oriented. The focus is on state of the methods in genome/transcriptome sequencing and protein analysis as well as transcriptomics/proteomics quantitative approaches. Knowledge about these methods are helpful for several other modules dealing with cellular/animal systems and might also be relevant for the pilot projects/master’s thesis. Parts of the module can also be used in other programs as currently in Master Molecular Medicine.

### 9 Assessment
The mark given will contribute to the final grade in proper relation to its credits.

### 10 Module convenor and main lecturers
Prof. Dr. Karl Köhrer, Prof. Dr. Kai Stühler, Dr. Gereon Poschmann, Dr. Nina Overbeck, Dr. Patrick Petzsch, Prof. Dr. Anna von Mikecz, Thorsten Wachtmeister

### 11 Further information
The regular participation in the lecture is strongly recommended. The content of the lectures is a prerequisite for the practical.
Module Number: 3a  
Title: Neurocytology, cell differentiation and regeneration of the nervous system

Module type: compulsory elective  | Language: English  | Group Size: 3 students
Study semester: 1  | Availability: winter semester  | Duration: 1 semester

Workload: 420 hrs  | Credits: 14CP  | Contact time: 124 hrs  | Independent study: 296 hrs

1 Courses
a) Lecture 2 PPW
b) Practical course 9 PPW

2 Intended learning outcomes
After completion of this module students
(1) will be familiar with the sterile preparation and cultivation of neural stem cells, primary neocortical cell cultures and enrichment/isolation of distinct neural cell types, human induced pluripotent stem cells (iPSCs), and human iPSC-derived neural progenitor cells (NPCs), neurons, and brain organoids
(2) will able to apply basic immunocytochemical techniques to identify and distinguish neural cell types using light and fluorescence microscopy,
(3) will have solid understanding of the development and differentiation of neural cells,
(4) will understand the basis of recombinant modulation of endogenous gene expression, and energy metabolism
(5) will be able to work independently and accurately with laboratory equipment,
(6) will be able to analyse and document experimental results according to good scientific practise standards,
(7) will be able to present and discuss experimental results and scientific context.

3 Content
Lectures:
Neurocytology: Neurons and glial cells - morphology and function in the nervous system, Neural stem cells; Development and differentiation of the nervous system: Induction, Neuro- and gliogenesis, Cell determination, Differentiation and axonal pathfinding, Neurotrophic support and apoptosis; Microglial polarization: Cell fate bioinformatics, CRISPR/CAS9 - gene revolution? Molecular pathophysiology and regeneration: Multiple sclerosis, traumatic nerve injury and regeneration; Energy metabolism in stem cells and neurogenesis; Mitochondrial diseases; High-content screenings; Neuronal differentiation of human stem cells in 2D and 3D (brain organoids)

Practical course:
The Küry lab belong to the Department of Neurology and will focus on cultivation and identification of neural cell types from rat brain (neural stem cells, neurons, astrocytes, oligodendrocytes, microglia) and analysis of neural differentiation with the following sets of experiments: Preparation and cultivation of primary cortical mixed cultures; application of light microscopy and immunofluorescence methods to demonstrate morphological cell differentiation and identification of cell maturation markers; Sorting, enrichment and isolation of distinct cell types using MACs or FACS techniques; Cell transfection to modulate endogenous gene expression and cell differentiation; RNA purification and quantification of differentiation markers using qRT-PCR; Polarization of primary microglial cells; Immunoassay (ELISA) to detect secreted immune-associated cytokines.
The Prigione lab belongs to the Department of General Pediatrics, Neonatology, and Pediatric Cardiology, at the University Clinic Düsseldorf (UKD) and will focus on human induced pluripotent stem cells (iPSCs) differentiated in 2D (neural progenitors and neurons) and 3D (brain organoids) to address changes in mitochondrial metabolism and in the context of disease modelling of neurological mitochondrial disorders. We will use the following sets of experiments: Cultivation of iPSCs, differentiation into neural progenitor cells (NPCs), neurons, and brain organoids, mitochondrial bioenergetics profiling with Seahorse technology, high-
content screening using mitochondrial functional parameters and neuronal branching capacity, DNA and RNA isolation for qPCR and CRISPR-Cas9 genome editing, immunostaining of pluripotency and neuronal markers.

**Final presentation:**
At the last day of the module, the students will give a scientific presentation and will defend and discuss the results of the practical course within the scientific context.

Workload: 420 hrs

Credits: 14 CP

Contact time: 225 hrs

Independent Study: 195 hrs

1 Courses
   a) Practical course: 8 SWS
   b) Lectures and Workshop: 2 SWS
   a) Seminar: 1 SWS

2 Intended Learning Outcomes

The students are able to describe and apply the fundamental concepts and techniques of fluorescence-based immunohistochemistry. They can use these concepts for the identification of various cell types and brain structures and make judgments regarding physiological and development-related questions. Students can use advanced techniques in light and fluorescence microscopy and adequately develop and evaluate the resulting documentation. They will learn to employ state of the art image analysis tools. They will know how to study basic physiological properties of brain cells using different techniques such as dynamic ion imaging and properly record, store, analyze, and illustrate the experimental data obtained with the specific techniques presented. They will learn to critically evaluate and interpret their experimental findings. They are able to give an informative overview of scientific questions, experimental design, results and interpretation of the performed experiments both in oral and in written form.

3 Content

Lecture: Molecular and cellular analyses of brain function

Brain development on the basis of selected brain regions (cortex, hippocampus, cerebellum).

Maturation and function of neurons and glial cells in vertebrate brains and synapse formation.

Molecular and cellular basis of neuronal and glial cell function, properties of glial cells and neuron-glia interaction, basic concepts of extra- and intracellular ion homeostasis, activity-related extra- and intracellular ion signaling (calcium, potassium, sodium, pH). Excitotoxicity and role of ion dysbalance in brain pathology. Glial cells as central elements in brain pathology.

Workshop: Fluorescence microscopy, Imaging, Electrophysiology

Basics of dynamic fluorescence imaging: Wide-field, confocal, multiphoton microscopy and FLIM. Superresolution microscopy: STED, SIM and PALM/STORM.

Imaging of ion-sensitive fluorescent dyes (sodium, calcium, pH, etc.).

Basics of electrophysiological techniques: whole-cell patch-clamp, ion-sensitive microelectrodes, field-potential recordings. Calculation of ion transporter properties.

General lab work, statistical analysis, presentation of data.

Basics of acute tissue slice, organotypic slice and primary culture preparation (virtual)

Practical course: Immunohistochemistry and Physiology

Immunohistochemistry: Primary and secondary immunofluorescence, identification of neural cell types, determination of the maturation stages of glial cells and neurons, marking of functionally relevant membrane structures in neurons and glial cells.
**Fluorescence microscopy**: Components of a light microscope, epifluorescence microscopy, confocal laser microscopy, camera-assisted documentation, image processing.

**Physiology**: Dynamic life imaging of intracellular ion signals under physiological and pathophysiological conditions (e.g. calcium imaging, sodium imaging and/or imaging of pH dynamics).

**Analysis**: Data analysis of given data sets/own data sets, statistics, arrangement of data in figures and presentation.

Development of the Nervous System. Sanes, Reh & Harris, Elsevier 2012.

Additional scripts and other documents will be available electronically through ILIAS.

### 4 Teaching methods
Lecture (virtual) and Workshop (virtually and/or face to face training), Practical course (virtually and hands on), Seminar (virtually and/or face to face training)

### 5 Prerequisites
**Formal**: Successful completion of module 1; Proficiency in English level B2 of Common European Framework of Reference for Languages (CEFR)
**With regards to content**: Knowledge of cell biology, chemistry, physics, mathematics as well as basic knowledge of neurobiology required.

### 6 Examination types
**Cumulative examination**: Written examination (90 minutes)

### 7 Requirements for award of credit points
Regular and active attendance at the practical course. Successful completion of a course project. Oral presentation in a seminar with an accompanying written hand out.

### 8 Module applicability (in other study courses)
The module is closely related to module 3a, especially when using immunohistochemistry or -cytochemistry in combination with fluorescence microscopy. The module is also used in Master Biology and Master Molecular Biomedicine.

### 9 Assessment
The mark given will contribute to the final grade in proper relation to its credits.

### 10 Module convenor and main lecturers
Dr. N. Gerkau, Prof. Dr. C. R. Rose, Dr. K. Kafitz

### 11 Further information
The regular attendance at the lectures and workshop is strongly recommended. The content of the lectures is prerequisite for the practical course and the seminar.
Module Number: 3c
Title: Cognitive Neuroscience: Methods

Module type: compulsory elective  Language: English  Group Size: 10 students
Study semester: 1  Availability: winter semester  Duration: 1 semester
Workload: 420 hrs  Credits: 14CP  Contact time: 165 hrs  Independent study: 255 hrs

1 Courses
   a) Lectures: 4 PPW
   b) Practical Course: 5 PPW
   c) Seminar 2 PPW

2 Intended learning outcomes
Upon completion of this module the students are able to explain and interpret modern imaging methods for representing the structures and functions of the human brain as well as methods for brain stimulation. These include magnetic resonance imaging (MRI), neuroinformatic tools and models, magnetoencephalography (MEG), electroencephalography (EEG), transcranial magnetic stimulation (TMS), transcranial direct and alternating current stimulation (tDCS/tACS), deep brain stimulation (DBS), and lesion-based neuropsychological approaches. This is complemented by an introduction to statistics and psychometric assessment. The students will be able to plan, develop and apply experiments employing these methods (including first knowledge in applying them), to evaluate and interpret the data thus gathered and to coherently present the results verbally and in writing.

3 Content
Lecture: Methods in cognitive neuroscience: from brain to behaviour
Methods of brain imaging and brain stimulation, neural rhythms and oscillatory networks, neuropsychology, statistical analysis approaches. psychometric assessment

Recommended reading:

Practical course: Measurement and modulation of human brain activity
1) Theoretical exercises on imaging techniques and neurophysiological methods: MEG and EEG (including planning, execution and evaluation of MEG and EEG examinations, derivation of eye movements and muscle activity, registration of movement kinematics, time frequency analyses, dipole analyses, co-registration of MRT and MEG), structural and functional MRI including morphometry, connectivity analysis and data-driven analyses, deep brain stimulation

2) Experimental neurophysiological and functional imaging applications for the examination of brain functions as well as their non-invasive modulation: Students will perform any of the following methods in the practical course: electroencephalography (EEG), transcranial magnetic stimulation (TMS), magnetoencephalography (MEG), transcranial electric stimulation (tDCS, tACS) as well as the analysis of structural or functional magnetic resonance imaging data.

3) Short presentation of experimental results at the end of the course.

Seminar: Application of neuroscientific methods to the study of cognitive systems
Functional neuroanatomy, brain network analysis, connectivity, event-related potentials, coherence analysis, neuropsychology, etc. applied to investigate motor and somatosensory systems, perception and attention, language, memory, emotion and motivation, social cognition.

Module Number: 3d
Title: Protein Pathology in Neurodegenerative Diseases and Mental Brain Disorders

Module type: compulsory elective  Language: English  Group Size: 3 students
Study semester: 1  Availability: winter semester  Duration: 1 semester

Workload: 420 hrs  Credits: 14CP  Contact time: 124 hrs  Independent study: 296 hrs

1 Courses
a) Lecture 2 PPW
b) Practical course 9 PPW

2 Intended learning outcomes
After completion of this module students

(1) will have a solid understanding of two of the most common and devastating brain diseases, the neurodegenerative disorder Alzheimer’s disease and the mental illness schizophrenia,

(2) will be familiar with the neuropathology and the clinical symptoms of these diseases, diagnostic methods, molecular disease mechanisms, and therapeutic options,

(3) will be able to explain the concept of protein pathology (misfolding and aggregation), which is fundamentally important in both neurodegenerative and a subset of mental disorders,

(4) will be able to ask scientific questions about brain diseases and will learn how to translate these questions into experiments,

(5) will be able to work independently and accurately with laboratory equipment,

(6) will be able to apply basic methods to express, detect, and analyze cellular proteins,

(7) will be able to analyse and document experimental results according to good scientific practise standards,

(8) will be able to present and discuss experimental results and scientific context.

3 Content
The supervision of the module will be shared equally by the Korth and Weggen research groups.

Lectures:
Mental disorders (Korth lab): introduction into mental disorders, genes, and biological modelling; recombinant proteins for biological use; DISC1 protein and the dopaminergic system; pathological protein multimers and conformers in neuroscience; physiological and pathological role of α-synuclein; proteostasis and the neuroscience of aging; insoluble proteins in mental illness; experimental theory and the importance of using controls.

Neurodegenerative diseases (Weggen lab): introduction to neurodegenerative disorders and Alzheimer’s disease; genetics and molecular pathogenesis, therapy and prevention; the intramembrane protease γ-secretase as a therapeutic target in Alzheimer’s disease; the role of glia cells in the disease; familial Alzheimer’s disease.
Practical course:
The Korth and Weggen labs belong to the Department of Neuropathology, and the students will practise a variety of experimental methods focussed on protein analysis in its facilities, and they will intensely interact with the research group members in the supervision of experiments, data analysis and documentation.

Weggen lab (days 1-8)

Exp1 – Pharmacological manipulation of amyloid-β peptide generation

Experimental methods: sterile culturing of different eukaryotic cell lines, pharmacological manipulation of cells; extraction and quantification of cellular proteins, SDS-PAGE and Western blotting; ELISA analysis of secreted proteins, fluorescence microscopy

Exp2 – Cellular uptake and degradation of amyloid-β peptides by monocytic cells

Experimental methods: culturing of human monocytes and differentiation into macrophages; quantification of cellular protein uptake (phagocytosis assay); quantitative real-time PCR

Korth lab (days 9-15)

Exp 1 - Expression of a bioactive recombinant protein in E. coli.

Experimental methods: culturing, transformation and lysis of bacterial cells; chromatographic purification of recombinantly expressed proteins; measuring concentration and purity of proteins by Nanodrop, BCA, and SDS-PAGE.

Exp 2 – Investigating dopamine uptake and its pharmacological manipulation in vitro

Experimental methods: sterile culturing of human neuroblastoma cells; pharmacological manipulation of cultured cells; fluorescence measurements, kinetic analysis

Exp 3 – Visualizing the dopamine system of the brain in wild type and transgenic rats.

Experimental methods: Cryo sectioning of rat brains; fixation of tissues; immunostaining and microscopy; quantification of anatomical changes (cell counting)

Final presentation:
At the last day of the module (day 16), the students will give a scientific presentation and will defend and discuss the results of the practical course within the scientific context.

4 Teaching methods
Lectures, interactive questionnaires, practical course with demonstrations and hands-on guidance (everybody will have hands-on experience), oral presentation, supervised protocol writing and data analysis

5 Prerequisites
Formal: Successful completion of module 1.
With regards to content: basic knowledge of neurobiology

6 Examination type: cumulative examination
Written exam (90 minutes, 70% of total grade)
Oral presentation of the practical course (15 minutes, 30% of total grade)

7 Requirements for award of credit points
Regular participation in the practical training. Final presentation of experiment results.
| 8 | **Module applicability** (in other study courses)  
The module is closely related to module 3a. The module is also used in Master Biology and Molecular Biomedicine (in combination with Module 3a). |
|---|---|
| 9 | **Assessment**  
The mark given will contribute to the final grade in proper relation to its credits. |
| 10 | **Module convenors and main lectures**  
Prof. Dr. Carsten Korth, Prof. Dr. Sascha Weggen, Dr. Andreas Müller-Schiffmann, Dr. Svenja Trossbach, Dr. Sarah Tschirner, Dr. Isabella Ogorek |
| 11 | **Further information**  
The regular participation in the lecture is strongly recommended. The content of the lectures is prerequisite for the practicals and the seminars. |

1. Courses
   - a) Lecture 2 PPW
   - b) Seminar: 1 PPW
   - c) Practical block course: 3 PPW

2. Intended Learning Outcomes
   Upon completion of this module the students are capable to describe how neuroscientific questions can be adequately addressed by neuroimaging techniques and to identify the appropriate imaging technique for a specific question. The students will be able to apply commonly used neuroimaging techniques in biomedical research with regard to human and animal studies. After attending the seminar the students will be capable to describe the regulatory and ethical prerequisites for clinical and experimental studies and fundamental principles of neuroimaging techniques.

3. Content
   The practical course will cover the main topics of design, application, performance and documentation of neuroimaging studies as part of clinical trials with respect to their use as primary trials for novel diagnostic methods or as secondary read-outs for the efficacy of a therapeutic candidate. The students will learn about the theoretical background of imaging techniques, mainly magnet resonance imaging (MRI) and positron emission tomography (PET) and radiation protection. Hands-on training in a representative set of practical experiments will reinforce the theoretically acquired knowledge.

4. Teaching Methods
   Block seminar and practical course

5. Prerequisites
   **Formal:** Successful completion of module 1. Proficiency in English level B2 of Common European Framework of Reference for Languages (CEFR)
   **With regards to content:** Participants who have a demonstrable focus on the area of neurosciences.

6. Examination Types
   Written Exam (multiple choice, 63 minutes)

7. Requirements for Award of Credit Points
   Attendance of the seminar and active participation in the exercises and hands-on training session, oral presentation and delivery of protocol, passing the written examination

8. Module Applicability (in other study courses)
   The module is closely related to module 2a, 4c and 6.

9. Assessment
   The mark given will contribute to the final grade in proper relation to its credits.

10. Module Convenor and Main Lecturers
    Prof. Dr. Andreas Bauer, Dr. David Elmenhorst, Dr. Ali Gordjinejad, Dr. Andreas Matusch, Dr. Simone Beer, Dr. Tina Kroll

11. Further Information
    Block seminar and practical course will be held at the Forschungszentrum Jülich. There will be a daily bus shuttle for participants between HHU and Forschungszentrum Jülich.

### Workload:
- Credits: 8 CP
- Contact time: 69 hrs
- Independent Study: 171 hrs
- Total Workload: 240 hrs

### Courses
1. a) Lecture 2 PPW
2. b) Practical course 4 PPW
3. c) Seminar 1 PPW

### Intended Learning Outcomes
The students are able to describe how behavioural states are organized on systemic, network-, cellular and molecular levels in relation to the daily circle. This includes sleep and waking, energy administration (temperature regulation, food intake and metabolism), and the release of hypothalamic hormones. The pathophysiology of these functions includes sleep disorders (e.g. narcolepsy, sleep apnoea), anorexia, obesity, central aspects of diabetes mellitus and neuroendocrine disorders. The students will be capable of observing behaviour, taking recordings from hypothalamic brain slices and primary cultures, performing neurotransmitter expression pattern analysis on brain sections, analysing receptor pharmacology and applying gene expression profiling. Students are capable to evaluate (data analysis), describe, interpret and document their experimental findings. They will demonstrate orally and in writing background, experimental approach, results and conclusions.

### Content

#### Lectures:
Starting from basics in physiology and endocrinology we will explain the daily organization of behaviour, physiology and pathophysiology of sleep-waking and consciousness and discuss new methods allowing identification of responsible neuronal groups and circuitries with new perspectives for therapy. Specific topics: clock genes, the various aspects of circadian rhythms, circadian and homoeostatic regulation of behavioural state, wake- and/or sleep-active neurons, morphological and biochemical components of energy administration (temperature and body weight regulation, feeding). Neurotransmitters and modulators involved in these functions with their localisation, mainly in the hypothalamus, and signalling pathways (GABA, glutamate, biogenic amines and hypothalamic peptides), endogenous sleep-promoting agents (adenosine, melatonin). Mechanisms of action of general anaesthetics. Pathophysiology of sleep, neurodegenerative and metabolic diseases.

#### Practical course:
Students will perform the following methods:
1) preparation of vital brain slices for electrophysiological recordings.
2) preparation and use of primary cultures, recording with 60 channels in microelectrode arrays.
3) preparation of acutely isolated hypothalamic neurons, mRNA harvesting after patch-clamp recording, single-cell RT-PCR.
4) primer design, real-time RT-PCR

#### Seminar:
Students give a presentation on selected seminal and recent papers of the field or progress report on experimental data from practical (Oral presentation e.g. Powerpoint).

Module Number: 4c
Title: Cognitive Neuroscience: Functional Systems

Module type: compulsory elective  
Language: English  
Group Size: 10 students

Study semester: 2  
Availability: summer semester  
Duration: 1 semester

Workload: 240 hrs  
Credits: 8CP  
Contact time: 50 hrs  
Independent study: 190 hrs

1 Courses
   d) Lectures: 2 PPW
   e) Seminar: 1 PPW

2 Intended learning outcomes
Upon completion of this module the students are able to describe the localization and functioning of a variety of important human brain systems that implement, for instance, the control of movement, perception, memory or emotions. They are capable to explain and interpret relevant phenomena, experimental paradigms and theoretical models as well as key findings pertaining to these functional systems. The students will be able to plan, develop, evaluate and interpret experiments and correlational studies on these brain systems, employing methods previously introduced in Module 3c.

3 Content
Lecture: Cognitive neuroscience: from brain to behaviour
Functional systems of the human brain: the motor system, control of movement and action planning, the somatosensory system and pain, perception and attention, memory systems, emotion and motivation, executive functions and decision-making, the language system, social neuroscience.

Recommended reading:

Seminar: Analysis and organization of cognitive systems
Zooming in on particular functional systems of the brain in health and disease and empirical approaches to their investigation.

4 Teaching methods
Lecture and seminar

5 Prerequisites
Formal: Successful completion of module 1. Proficiency in English level B2 of Common European Framework of Reference for Languages (CEFR); Bachelor degree in biology, psychology or a related field

With regards to content:
Basic knowledge of neuroanatomy and neurophysiology are a prerequisite. Successful completion of module 3c (or equivalent knowledge about neuroscientific methods).

6 Examination type:
Cumulative Examination:
1. Oral presentation (e.g. Powerpoint) in seminar (15 minutes, 33.3% of total grade).
2. Written exam (multiple-choice format) on lecture content (100 minutes, 66.7% of total grade).

1 Courses
   a) Lectures 4 PPW
   b) Practical Course 5 PPW
   c) Seminar 2 PPW

2 Intended Learning Outcomes
   After completion of this module the students are able to describe the immune system and its relevance to physiological and pathological conditions of the nervous system. The students are able to define following terms: immune responses, blood brain barrier, antigen presentation, regulatory/effector immune cells, apoptosis, molecular mimicry, immunological diseases, autoimmunity, inflammatory conduction block. They are capable to hypothesize on possible mechanisms involved in the development of neurological diseases and possible immunological therapy approaches. They will be able to present a link between inflammation and degeneration and to summarize possible mechanisms of neuronal and glial damage in neuroinflammation and degeneration, comprising both primary and secondary neuroinflammatory diseases.

3 Content
   Practical course
   The module *Neuroimmunology* is embedded in current research and will cover the following topics:
   1. Basics of immunology/regulation of the immune response
   2. Chronic inflammatory disorders of the nervous system
   3. Interactive exercises: animal models for autoimmune disorders of the central and the peripheral nervous system (CNS/PNS)
   4. Interactions of immune cells and cells of the CNS and PNS: damage mechanisms and role of glia
   5. Detection of inflammatory neurodegeneration *in situ* and *in vivo* (theory, preclinical animal experimental models + patient, imaging & optical coherence tomography & electrophysiology)

   Students will perform methods form the following list during the practical course:
   **Immunology**: Isolation and culture of immune cells from lymphatic organs and the nervous system. Investigation of immune cell function & phenotype (incl. multicolour flow cytometry, \[^{[H]}\] thymidine proliferation assays, cytokine ELISPOT & ELISA, migration assays). Induction of experimental disease in mouse and rat models of MS (experimental autoimmune encephalomyelitis/EAE), inflammatory neuropathies (experimental autoimmune neuropathy/EAN) and stroke (middle cerebral artery occlusion/MCAO). Investigation of immunological determinants in further neurological disorders such as brain ischemia
   **Neurobiology**: Qualitative and quantitative histology and immunohistochemistry for major cell populations of the nervous system, including glia. Investigation of CNS neurogenesis *in vitro, in situ* and *ex vivo* considering the major neurogenic niches. Neurological (clinical) scoring of animals affected by chronic autoimmune disease. Electrophysiological examination of nervous system function. Detection of inflammatory neurodegeneration with PET and MR imaging as well as optical coherence tomography (OCT) *in vivo*. Living organotypic brain slices: preparation and comprehensive study by confocal microscopy, also using interaction models (co-culture of slices with immune cells).

Independent study: 297 hrs

1 Courses
   a) Lectures: 4 SWS
   b) Seminar: 2 SWS
   c) Practical course: 5 SWS

2 Intended learning outcomes
After completion of this module, students will be familiar with
   1. Knowledge on stem cells, pluripotent and induced pluripotent stem cells (iPSCs)
   2. 3D in vitro models such as human brain organoids
   3. Theoretical knowledge on iPSCs and brain organoid generation
   4. Principles of neural stem cell biology
   5. Theoretical knowledge on brain development and disease modelling using human brain organoids
   6. Cellular organelles regulating neural stem cells proliferation and differentiation
   7. Handling and culturing of neural stem cells
   8. Immunostaining and imaging of stem cells including cancer stem cells
   9. Sectioning of human brain organoids, immunostaining and high resolution imaging

3 Content
Lectures:  

Practical courses:  
Introductions to light microscopy and image analysis. Microscopic examinations of iPSCs and iPSC-derived neural stem cells. Analysis of neural stem cells with various markers. Introduction to culturing iPSCs, neural stem cells and cancer stem cells. Analysis of cellular organelles and their dynamics. Chemical compounds treatments that target cancer stem cells. Introductions to brain organoids handling, imaging and analysis. Image processing and analysis.

Seminar: Short presentation of experimental results at the end of the course and/or presentation of selected scientific papers on the relevant topic. Each participating student will be instructed about the content of the presentation.

4 Teaching methods
Lectures on general topics of developmental neurobiology, stem cells and brain organoids. Seminar and practical courses with accompanying lessons.

5 Prerequisites

Workload: 420 hrs
Credits: 14 CP
Contact time: 123 hrs
Independent Study: 297 hrs

1 Courses
   a) Lectures 3 PPW
   b) Practical courses 6 PPW
   c) Seminars 2 PPW

2 Intended Learning Outcomes

This module consists of two parts:
1. Histochemical techniques for neuronal and glial characterization
2. Electrophysiology

After completion of the first part students will be able to describe the cellular composition of the central nervous system with strong emphasis of developmental changes, cellular function and species differences addressing model species such as mouse and rat in comparison to higher primates and humans. They will be able to describe marker epitopes and their combinations, which will characterize specific cells and the functional or pathophysiological state as a basis for their immunohistochemical identification. They will be capable to explain the production of epitope-specific antibodies. Students will be able to perform tissue preparation and to apply immunohistochemical staining techniques including the appropriate controls as well as microscopic evaluation of the results. They will be able to present orally their experiments and test results to the peers.

After completion of the second part the students will be capable to explain the principles of electrophysiological recordings. They will be able to design and to perform electrophysiological experiments, to document and analyse their results and to summarize their findings in form of a scientific report.

3 Content

In the first part students will be introduced to the principals of: Animal anaesthesia and euthanasia. Hands on: Tissue dissection & preparation, tissue fixation methods, and methods for tissue embedding for light- or electron microscopy. The preparation of tissue sections (brain) and the preparation for immunohistochemistry, immunohistochemical staining techniques and final preparation of the tissue for microscopy including microscopic evaluation and data analysis.

In the second part students will learn to record and to interpret single-unit and network neuronal activities in rodent brain slices and primary cultures using microelectrodes and the patch-clamp technique. Human brain electrophysiological data analysis will be performed and discussed. Field potentials, action potentials, spontaneous synaptic activities, voltage- and ligand-gated ion channels will be studied. Neuronal identification will be performed with electrophysiological, pharmacological, immunohistochemical and molecular-biological (single-cell RT-PCR) methods. Transgenic mouse lines with a fluorescent reporter protein expressed under control of a cell-type specific promoter will be provided.

1 Courses
a) Placement 4 PPW  
b) Lecture 1 PPW  
c) Seminar 1 PPW

2 Intended Learning Outcomes

This module consists of two parts: Research ethics and a 4-week lab rotation (part research technics).

The idea of an integrative module stems from the need for making the students duly aware of the practical (ethical and pragmatic) and theoretical dimensions of their own science, and of the non-trivial interactions between the two levels. The integration of the ethical module with the lab rotation should help by providing the students first-hand experience (in a relatively short time) of the many facets of neuroscientific research, as well as with the tensions and contradictions internal to the field.

The way science is conceptualized and practiced today has been shaped by historical developments, and neuroscience has complex ethical and social dimensions. In the research ethics part students should recognize and understand that science is a social and cultural activity.

After attending the research technics part the students should be able to independently carry out experiments with the technics they have learned during their stay in different laboratories (lab rotation). The type of technics learnt will depend on the working group.

Upon completion of the research ethics part the students will be able to describe the basics in philosophy of science, including the logic of science and the role of norms and values in science, the role of rhetoric language and metaphors in science, theoretical and historical foundations of neuroscience, models of reasoning in biomedical ethics and research ethics, with a special focus on research on humans and research data management (patient autonomy, record keeping, data protection and safety). They will be able to understand the “usefulness of useless knowledge” (Russel) and will be able to understand, analyse and present scholarly texts, critically reflect upon current research, including its historical, social, and ethical dimensions and test coherence and consistency of ethical arguments. They will be able to present these acquired skills in a reduced form in a poster format.

3 Content
Lectures and Seminars:
- Basics of biomedical ethics
- Critical history of the neurosciences
- Research ethics (on animal and human subjects)
- International and national bioethical guidelines
- Waste and attrition in translational research
- Current topics in neuroethics
- Neuroscience, Identity and “Free Will”
### Practical:  
The lab rotation is a practical in different laboratories (lab rotation) to get profound insight into specific methodologies and scientific questions. After its completion, a summary of the experimental work is to be drawn up and to be presented orally during the faculty seminar of the working group. The methods learnt will depend on the working group.

### 4 Teaching methods  
Lecture, seminar with oral reports, group work, collective poster presentation

### 5 Prerequisites  
**Formal:** Successful completion of module 1. Depends on faculty or working group.  
**With regards to content:** Depends on faculty or working group.

### 6 Examination types  
Poster presentation (30 minutes): Poster (50% of overall mark) and individual oral presentation (50% of overall mark).

### 7 Requirements for award of credit points  
Participation in the seminars and lab rotation. Presentation of own results/data gathered during the lab rotation in the institute’s seminar. A pass in the poster presentation. Return signed and filled in routing card to coordinator.

### 8 Module applicability (in other study courses)  
The module is compulsory and teaches contents in ethics. The lab rotation should give an insight into different laboratories.

### 9 Assessment  
The mark given will contribute to the final grade in proper relation to its credits.

### 10 Module convenor and main lecturers  
Prof. Dr. Heiner Fangerau, Dr. Fabio de Sio, for the lab-rotation: variable

### 11 Further information  
Lab-Rotation: Register directly with the faculty/working group. Minimum stay per lab is 1 week. Return signed and filled in routing card to coordinator.

**Module type:** compulsory  | **Language:** English  | **Group Size:** 20 students

**Study semester:** 3  | **Availability:** winter semester  | **Duration:** 12 weeks

**Workload:** 450 hrs  | **Credits:** 15 CP  | **Contact time:**  | **Independent Study:**

1. **Courses**
   a) Placement
   b) Faculty Seminar
   c) Seminar Scientific Writing and Presenting 1 PPW

2. **Intended Learning Outcomes**
The Pilot Project serves to illustrate research activities in a working group on a given experimental project. Students perform a 12-week placement in a working group. They are assigned to a specific experimental project on which they can work under one-to-one supervision. The ability of adequately reporting scientific results is supported by an accompanying seminar in scientific writing and presenting.

After the completion of the module, the students should be able to independently perform the experiments carried out in the respective working groups. They are able to summarize their experimental work in writing and present it orally.

3. **Content**
   **Placement:**
   The content is variable and depends on the working group.

   **Faculty Seminar:**
   The experimental data of the assigned project is to be presented orally at the faculty seminar.

   **Seminar Scientific Writing and Presenting:**
   Introduction to preparing scientific publications (e.g. paper, poster) and oral presentations.

4. **Teaching methods**
   Practical course and seminar, lectures as part of faculty seminar, summary of experimental work

5. **Prerequisites**
   **Formal:** Depends on faculty or working group; Successful completion of modules no. 1 to 6. Proficiency in English level B2 of Common European Framework of Reference for Languages (CEFR)

   **With regards to content:**

6. **Examination types:**
   Oral presentation of experimental work (30 minutes)

7. **Requirements for award of credit points**
   Regular participation in the placement and seminars, delivery of a written summary of experimental work, a pass in the module final exam.

8. **Module applicability (in other study courses)**
   None

9. **Assessment**
   The mark given will contribute to the final grade in proper relation to its credits.

10. **Module convenor and main lecturers**
    Seminar "Scientific Writing and Presenting": Studierendenakademie of HHU Düsseldorf
    Placement and Faculty Seminar: Variable

11. **Further information**
    Placement: Register directly with the faculty/working group. Return signed and filled in routing card to coordinator.

</tr>
</tbody>
</table>

### Courses
1. Placement
2. Faculty Seminar
3. Lecture Data Analysis 1 PPW
4. Practical Course Data Analysis 2 PPW

### Intended Learning Outcomes
The project proposal serves as a preparatory exercise for the Master’s thesis. Students perform an 8-week placement in a working group on an experimental project of their choice. After completion a project sketch for the Master’s thesis is to be drawn up. Lectures and practicals in statistical data analysis support the ability of the students to statistically analyse their data.

After completing the module the students should be able to independently carry out a self-selected experimental project in the field of translational neuroscience. They are capable to draw up and present a written concept (project sketch) for the Master’s thesis. Upon completion of the data analysis part the students will be able to perform statistical analyses of different types of medical and biological data and to employ the statistical software R for these data analyses. The students will acquire knowledge on statistical methods such as testing procedures, analysis of variance, regression approaches, and principle component analysis, on how to use these methods for a statistical data analysis, as well as on good practice in planning a study, preparing data sets for a statistical analysis, and presenting the results of such analyses.

They will be able to decide which of these methods to use in which situation and to apply these procedures to the data.

### Content
1. Placement:
   Students perform an 8-week placement in a working group on an experimental project of their choice. The topic of the experimental work performed is variable and depends on faculty or working group.

2. Faculty Seminar:
   The project is to be presented orally at the faculty seminar.

3. Lectures Data Analysis:
   The course starts with a basic, practical introduction to the statistical software environment R, which is the most popular, advanced software for statistical data analysis. This knowledge on R is successively extended during the course. It is discussed how graphics and descriptive statistics can be generated in R and should be generated in general to present and summarise the data and the results of a data analysis in a best practice way. General statistical procedures such as testing approaches, multiple testing methods, analysis of variance, regression approaches (e.g., linear and generalized linear models), and dimension reduction procedures (e.g., principle component analysis) often used in the statistical analysis of medical, biological, and genetic data are described, focussing on the practical aspects of these procedures. Moreover, good practice in planning a study as well as in preparing a data
set for a statistical analysis in, e.g., R is discussed. This last part of the data analysis course is tailored to the specific needs of the current Master students and allows them to ask specific questions concerning the statistical aspects of their project proposal.

d) **Practicals Data Analysis:**
All methods taught in the data analysis lecture are practised by the students by applying them, in particular, in R to data from different types of studies. If already available, the students can bring their own data and apply the procedures to these data during the practicals.

1. **Courses**  
   a) Placement  
   b) Faculty seminar

2. **Intended Learning Outcomes**  
   After completing the Master’s thesis, the students should be able to independently carry out, summarize in writing and present orally an experimental project of significant novelty value.

3. **Content**  
   The Master’s thesis is an independent experimental work based on the project proposal. Students complete a six-month experimental working phase with compulsory participation in the faculty seminars. The experimental work is in the field of translational neuroscience and dependent on the working group.

4. **Teaching methods**  
   Supervised independent experimental work in a lab, oral and written progress reports, final oral presentation (colloquium), practical course, project sketch

5. **Prerequisites**  
   **Formal:** Successful completion of all previous modules (90 CPs have to be acquired); Proficiency in English level B2 of Common European Framework of Reference for Languages (CEFR)  
   **With regards to content:** Depends on faculty or working group

6. **Examination types**  
   Written Master’s thesis (50 – 80 pages, 80% of overall mark)  
   Final colloquium (30 minutes, 20% of overall mark)

7. **Requirements for award of credit points**  
   Participation in the faculty seminar, presentation of own results/data in the faculty seminar; delivery of written Master’s thesis and colloquium about Master’s thesis.

8. **Module applicability (in other study courses)**  
   None

9. **Assessment**  
   The mark given will contribute to the final grade in proper relation to its credits.

10. **Module convenor and main lecturers**  
    Variable
